

Route A, training seed 0. Each cell = Trend error of one column pair, 100 × (1 − score) of sdmetrics' Column Pair Trends inside TabDiff's own evaluate_density (CorrelationSimilarity for two numerical columns, ContingencySimilarity otherwise), mean over the 20 tables; columns in TabDiff's evaluation order (numerical block, then categorical, ᶜ). Panel mean = the run's Trend error (equals all_results.csv). One colour scale per dataset row; difference panel: pp, red = the adaptive rule worse than fixed. Values printed for beijing.
